

Build trust into a data decision

Follow one important decision to identify the information and ownership it requires.

01 **Decision**

What will someone do differently?

02 **Information**

Which records are needed, and when?

03 **Meaning**

What do the terms, states, and measures mean?

04 **Ownership**

Who maintains the source and resolves discrepancies?

05 **Quality**

What level of completeness, accuracy, and timeliness is needed?

06 **Action and learning**

Who acts, and how will we know the decision improved?

Begin with a bounded use case

Measure the result: less reconciliation, a more dependable handoff, or a better decision.
Expand the architecture as evidence supports it.
